SENSORS

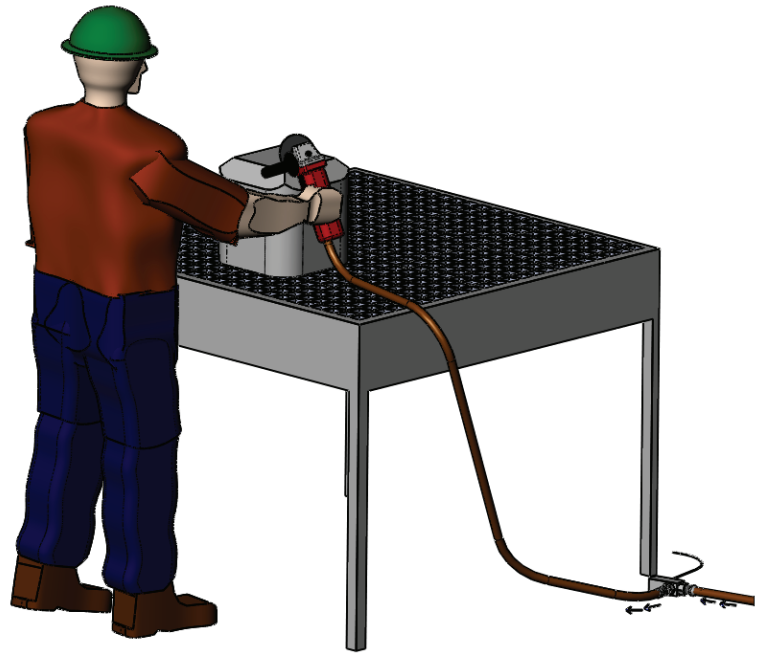

PNEUMATIC FLOW

The **Ivec Pneumatic Flow Sensor**, when used in conjunction with an Ivec System, assures that once the sensor is activated by air moving through the line, the associated auto gate opens.

As the gate opens the Ivec control system proceeds to vary the speed of the motor to accommodate for the change to the system and when all sensors are in the off position, stops the dust collector motor entirely; saving energy.

Off Position

On Position

Use the **pneumatic flow sensor for** composite type applications where a current sensor is not applicable.

Applications: Grinding (Pneumatic) • Sanding (Pneumatic) • Air Wand

Intelligent Ventilation Energy Controls
